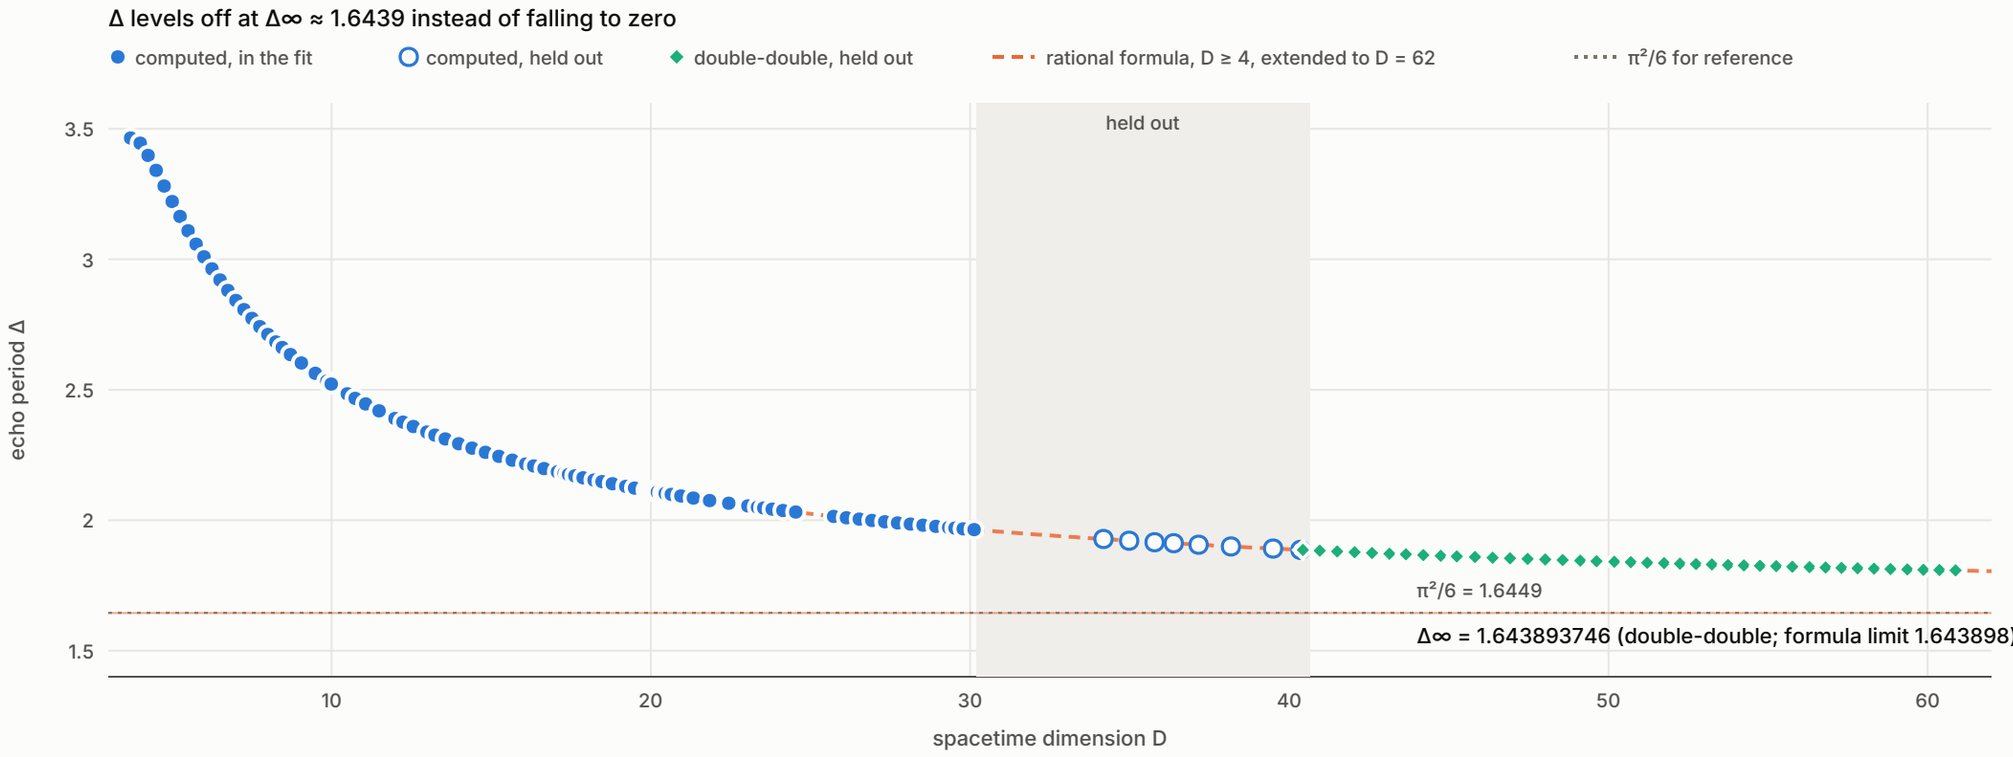
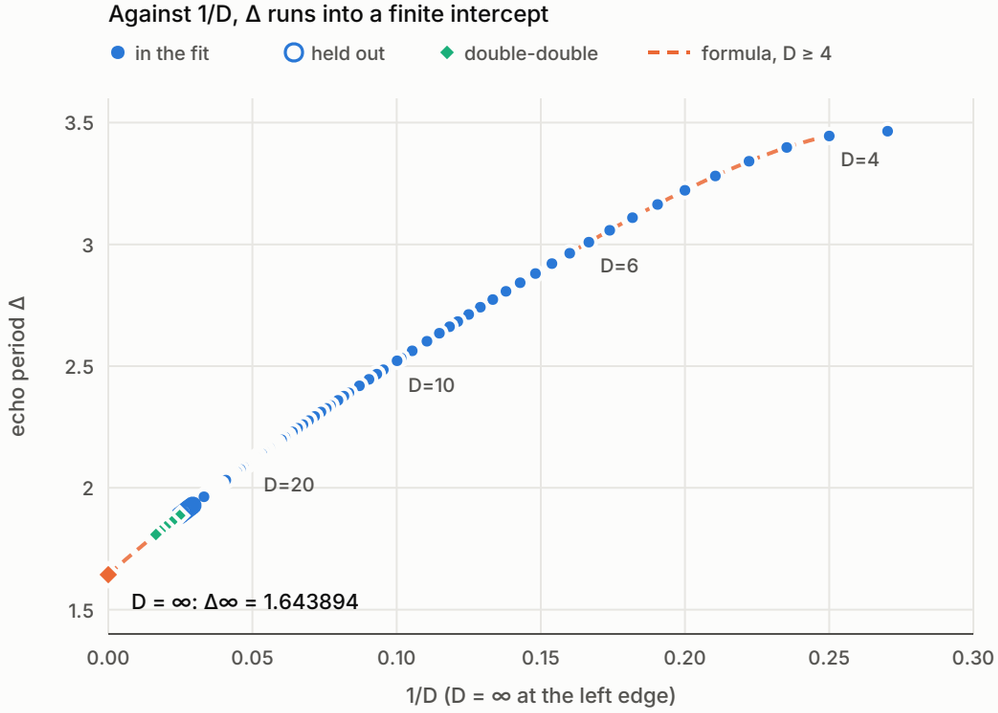
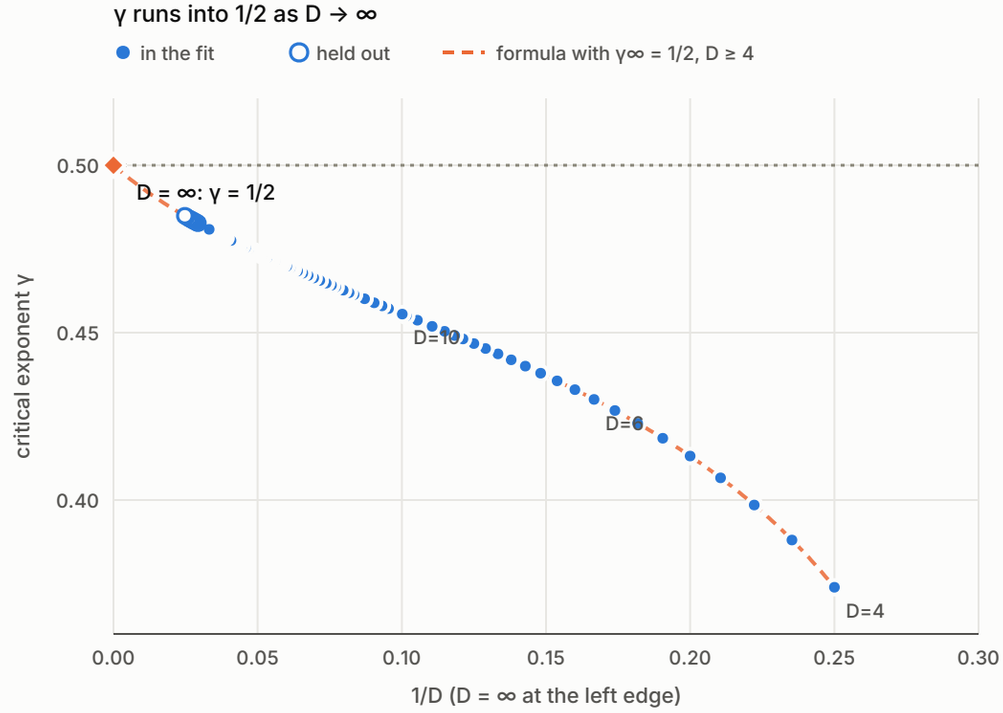
Choptuik echo period Δ(D) and critical exponent γ(D) of massless scalar collapse

One rational formula in 1/(D−2) for all D ≥ 4, fitted on the computed points 4 ≤ D ≤ 30.2; the 8 hollow points above are held out and match it to 2e-06, and the double-double points (green) up to D = 61 to 6e-08. Δ∞ = 1.643893746 from the double-double points, γ∞ = 1/2







Spectral multiple shooting with nonlinear elimination (solver/CONTEXT.md); hover a point for its value, a curve for its coefficients
